

In the Claims:

1. (currently amended) A wirefilm for electrically interconnecting a first component having a plurality of first bonding sites and a second component having a plurality of second bonding sites, the wirefilm comprising:

a discontinuously movable, substantially planar film; and

a plurality of spaced apart groups of wire strands, each group of said plurality of groups extending generally outwardly from a central region in a non-overlapping different direction, each wire strand of each group of wire strands having a first end and an opposing second end, the first end of each wire strand of said each of said groups of wire strands operable to contact a said second bonding site to electrically interconnect the first component and the second component, each wire strand between the first end and the second end being substantially fully embedded in said film except for said first and second ends.

2. (previously presented) The wirefilm of Claim 1, wherein the film comprises a plastic polymer.

3. (canceled)

4. (previously presented) The wirefilm of Claim 1, further comprising an adhesive layer operable to couple the wirefilm to the first component and the second component.

5. (canceled)

6. (previously presented) The wirefilm of Claim 1, further comprising ~~a~~ an film tape carrier removably coupled to the film, the film tape carrier operable to advance the film from a first position to a second position.

7-20 (canceled)

21. (currently amended) A wirefilm for electrically interconnecting a first component having a plurality of first bonding sites and a second component having a plurality of second bonding sites, the wirefilm comprising:

a discontinuously movable substantially planar film; and

a plurality of spaced apart groups of wire strands, each group of said plurality of groups extending generally outwardly from a central region in a non-overlapping different direction, each wire strand of each group of wire strands having a first end and a second end, the first end of each wire strand of each group of wire strands operable to contact a said first bonding site and the second end of each wire strand of ~~said~~ one of said groups of wire strands operable to contact a said second bonding site to electrically interconnect the first component and the second component, each wire strand comprising a loop portion relaxed and located entirely between the first end and the second end, the loop portion spaced apart from said film.

22. (previously presented) The wirefilm of claim 1', wherein the film comprises a plastic polymer.

23. (previously presented) A wirefilm for electrically interconnecting a first component having a plurality of first bonding sites and a second component having a plurality of second bonding sites, the wirefilm comprising:

a substantially planarizable film; and

a plurality of wire strands, each wire strand having a first end and a second end, each wire strand coupled to the film according to the relative positions of the first component and the second component, the first end of each wire strand operable to contact a first bonding site and the second end of each wire strand operable to contact a second bonding site to electrically interconnect the first component and the second component, each wire strand comprising a loop portion relaxed and located entirely between the first end and the second end, the loop portion spaced apart from said film;

wherein at least a portion of each wire strand between the first end and the second end is embedded in said film.

24. (previously presented) The wirefilm of claim 21 further comprising an adhesive layer operable to couple the wirefilm to the first component and the second component.

25. (previously presented) The wirefilm of claim 21 further comprising a film tape carrier removably coupled to the film, the film tape carrier operable to advance the film from a first position to a second position.

26. (currently amended) Apparatus for making an electrical connection between a first component and a second component with a wirefilm which comprises:

a first component having first bonding sites thereon;

a second component having second bonding sites thereon; and

a discontinuously movable wirefilm for electrically interconnecting bonding sites of said first component and said second component sites, the wirefilm comprising:

a substantially planar film; and

a plurality of spaced apart groups of wire strands, each group of said plurality of groups extending generally outwardly from a central region in a non-overlapping different direction, each wire strand of each group of wire strands having a first end and an opposing second end, the first end of each wire strand of each group of wire strands contacting a said first bonding site and the second end of each wire strand of said one of said groups of wire strands contacting a second bonding site to electrically interconnect the first component and the second component, each wire strand between the first end and the second end being embedded in said film.

27. (previously presented) The apparatus of claim 26 further comprising an adhesive layer operable to couple the wirefilm to the first component and the second component.

28. (previously presented) The apparatus of claim 26 further comprising a film tape carrier removably coupled to the film, the film tape carrier operable to advance the film from a first position to a second position.

29. (currently amended) Apparatus for making an electrical connection between a first component and a second component with a wirefilm which comprises:

a first component having first bonding sites thereon;

a second component having second bonding sites thereon; and

a wirefilm for electrically interconnecting bonding sites of said first component and said second component sites, the wirefilm comprising:

a discontinuously movable substantially planar film; and

a plurality of spaced apart groups of wire strands, each group of said plurality of groups extending generally outwardly from a central region in a non-overlapping different direction, each wire strand of each group of wire strands having a first end and a second end, the first end of each wire strand of said one of said groups of wire strands operable to contact a first bonding site and the second end of each wire strand of said one of said groups of wire strands operable to contact a second bonding site to electrically interconnect the first component and the second component, each wire strand comprising a loop portion relaxed and located entirely between the first end and the second end, the loop portion spaced apart from said film.

30. (previously presented) The apparatus of claim 29 wherein the film comprises a plastic polymer.

31. (previously presented) The apparatus of claim 29 wherein at least a portion of each wire strand between the first end and the second end is embedded in said film.

32. (previously presented) The apparatus of claim 29 further comprising an adhesive layer operable to couple the wirefilm to the first component and the second component.

33. (previously presented) The apparatus of claim 29 further comprising a film tape carrier removably coupled to the film, the film tape carrier operable to advance the film from a first position to a second position.
